PALADIN HEAVY CONSTRUCTION

Paladin Heavy Construction Product Safety Program

January 1, 2009

As the recognized leader in the construction coupler and attachment industry, we have always placed the highest priority on safety. Since designing the original secondary locking device for operational safety, we have continued to improve our couplers and their safety mechanisms.

We were the first industry manufacturer to commit to a comprehensive Hydraulics and Product Safety Training Program. Utilizing highly experienced staff resources, this program has had 10,000 dealers and contractors, operators and mechanics enrolled in these classes since it's inception in 2004. Not only have these classes been given in 34 states, AEM invited one of our trainers to make a presentation to their Product Safety and Liability seminar. OSHA has attended some of our classes as well as enlisted our training classes for several of their offices.

The construction industry is not without hazards. Many incidents could be avoided with a better understanding of the issues involved. While we have designed one of the safest couplers in the industry, nothing can replace properly trained employees. This is why we continue to offer safety training to those who recognize the need.

Please consider this opportunity to educate your people and your customers in the important product safety issues. To find out more or schedule a class, call Tim Mulhollen at 330-734-3000 x31253.
